**Midterm Activity #5: Personal Expense Tracker**

**Instructions**

1. Create a Java program named **ExpenseTrackerLastName**.
2. Implement the following methods:
    - A **void method** that displays the program title.
    - A **non-void method** that calculates the total expenses using three values:
        - food
        - transportation
        - other expenses
    - A **non-void method** that checks if the total expense exceeds a budget and returns a message.
    - A **void method** that displays the total expense and the budget status.
3. In the main method:
    - Call all the methods you created.
    - Display the final output clearly.
4. Use **appropriate method names, parameters, and return types**.
5. Add **at least TWO enhancement**:
    - Accept user input
    - Add another expense category
    - Compute remaining budget
    - Display a personalized message
6. Ensure your program:
    - Compiles without errors
    - Produces correct output

**Submission Format**

- Submit the Java source code file (.java).
- The filename must follow this format: ExpenseTrackerLastName.pdf or ExpenseTrackerLastName.docs
- Include screenshots of the program output showing the following:
    - User input
    - Program processing
    - Final output/result
- The screenshot must clearly display the entire console output.

**Academic Integrity Policy**

- Students must write their **own program**.
- The following are **not allowed**:
    - Copying code from classmates.
    - Sharing source code.
    - Downloading solutions from the internet.
- Students with **identical programs may receive a score of 0**.

```java
import java.util.Scanner;

public class ExpenseTrackerBeros {
    public static void displayTitle() {
        System.out.println("==================================");
        System.out.println("      PERSONAL EXPENSE TRACKER      ");
        System.out.println("==================================");
    }

    public static double calculateTotal(double food, double transport, double other, double entertainment) {
        return food + transport + other + entertainment;
    }

    public static String checkBudget(double total, double budget) {
        if (total > budget) {
            return "⚠️ You have exceeded your budget!";
        } else {
            return "✅ You are within your budget.";
        }
    }

    public static void displayResult(String name, double total, double budget, double remaining, String status) {
        System.out.println("\n====== EXPENSE SUMMARY ======");
        System.out.println("User: " + name);
        System.out.println("Total Expenses: " + total);
        System.out.println("Budget: " + budget);
        System.out.println("Remaining Budget: " + remaining);
        System.out.println("Status: " + status);
    }

    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        displayTitle();

        System.out.print("Enter your name: ");
        String name = scanner.nextLine();

        System.out.print("Enter your budget: ");
        double budget = scanner.nextDouble();

        System.out.print("Enter food expense: ");
        double food = scanner.nextDouble();

        System.out.print("Enter transportation expense: ");
        double transport = scanner.nextDouble();

        System.out.print("Enter other expenses: ");
        double other = scanner.nextDouble();

        System.out.print("Enter entertainment expense: ");
        double entertainment = scanner.nextDouble();

        // Process
        double total = calculateTotal(food, transport, other, entertainment);
        String status = checkBudget(total, budget);

        double remaining = budget - total;

        // Display output
        displayResult(name, total, budget, remaining, status);

        scanner.close();
    }
}
```
